The specification describes a beta-secretase enzyme. The enzyme cleaves beta-amyloid precursor protein to produce beta-amyloid peptide. This enzyme is therefore implicated in the production of amyloid plaque components which accumulate in the brains of individuals afflicted with Alzhaimer's disease. Inhibitors of beta-secretase are administered to a mammalian subject e.g. with Alzheimer's disease or Alzheimer's diseaserike plaque burden. The compounds are used for the treatment of amyloidogenic diseases e.g. Alzhaimer's disease. represents an inhibitor of beta-secretase enzyme.
                                                                                                                                                                                 Purified beta-secretase protein used in assays to discover inhibitors which can be used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta-secretase; beta-amyloid precursor protein; beta-amyloid peptide; amyloid plaque component; Alzheimer's disease; amyloidogenic disease; inhibitor.

The invention describes an isolated taste transduction G-protein coupled receptor (I) e.g., T2R which is expressed in a taste cell, comprises or seceptor (I) e.g., T2R which is expressed in a taste cell, comprises or greater than 60% sequence identity to a fully defined sequence of 335 (S1), 333 (S2), 299 (S3), 310 (S4), 224 (S5), 77 (S6), 209 (S7), 266 (S16), 300 (S10), 155 (S11), 173 (S12), 94 (S13), 115 (S14), 68 (S15), 300 (S10), 186 (S16) amino acids as given in the specification. (S1) is useful for identifying a compound that modulates taste signaling in taste cells which involves contacting the compound with (I) and effect is determined by measuring che compound (I). The functional effect of the compound (I). The functional effect is determined by measuring binding of the compound to a call membrane. (The functional effect is determined by determined compound (I). (I) is sexpressed in the compound activity of calls (e.g., eukaryotic cell) expressing (I). (I) is captesing (I). (I) caste cells which involves contacting a compound with (I). The compound with the polynucleotide encoding (I) and determining the functional effect of the compound with the polynucleotide encoding (I) and determining the functional effect of the compound with the polynucleotide encoding (I) and determining the functional effect of the compound with the polynucleotide encoding (I) and determining the contacting the compound with the polynucleotide encoding receptor.
                                                                                                           Novel isolated taste transduction G-protein coupled receptor e.g., T2R useful for identifying compound that modulates taste signaling in taste
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Proteus mirabilis infection; bacterial infection; antibacterial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a beta-secretase enzyme. The enzyme cleaves beta-amyloid precursor protein to produce beta-amyloid peptide. This enzyme is therefore implicated in the production of amyloid plaque components which accumulate in the brains of individuals afflicted with Alzheimer's disease. Inhibitors of beta-secretase are administered to a mammalian subject e.g. with Alzheimer's disease or Alzheimer's disease. Is they maintain or improve cognitive ability or reduce the plaque burden. The compounds are used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease. The present sequence represents an inhibitor of beta-secretase enzyme
                                                                                                                                                                                                                                                                                                                                         Purified beta-secretase protein used in assays to discover inhibitors which can be used for the treatment of amyloidogenic diseases e.g. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to new Proteus mirabilis polypeptides and polymucleotides. The invention also relates to antibodies against the polypeptides, amethod of generating vaccines for producing the polypeptides, amethod of polypeptides and method of polypeptides and amethod for screening test compounds for mirabilis, and polymeptide and a method for screening test compounds for antibation activity. The polypeptides and polymucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial days or as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                        New Proteus mirabilis polypeptides and polynucleotides, useful reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or biocontrol agents for plants.

organism particularly analysis, applicable in genome of c Method for disrupting targeted gene in thermostable bacterium and with genome studying gene structure and functions.

Claim 9; SEQ ID NO 216; 598pp; Japanese.

This invention relates to a novel method for targeting disruption of an

whole sequential data of the genome of such organism, selecting at least I arbitrary region in the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly thermococcus kodakaraensis KODI. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology, with this method, the disruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein concoded by the genome of Thermococcus kodakaraensis which was derived using the method of the invention. Note The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at arbitrary gene in a genome of an organism which comprises providing the ftp.wipo.int/pub/published_pct_sequences

Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms

Claim 5; SEQ ID NO 2285; 261pp + Sequence Listing; English

The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as

                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a activity of a gene in an operon required for proliferation or the activity of against a biological pathway required for that has an activity against a biological pathway; che gene product or that has an activity against a biological pathway; che gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound; activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of
                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                            Antisense, prokaryotic essential gene, cell proliferation; drug design.

ö
strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at five published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid; a vector comprising a promoter operably linked to the nucleic acid nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense; prokaryotic essential gene; cell proliferation; drug design.

Method for disrupting targeted gene in genome of organism particularly thermostable bacterium and with genome chips for analysis, applicable in studying gene structure and functions.

Claim 9; SEQ ID NO 1428; 598pp; Japanese.

This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential data of the genome of such organism, selecting at least

```
ransformation, which the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly Thermococcus kodakaraensis KODI. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the disruption of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived to sing the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Porphorymonas gingivalis; PG; periodontal disease; gingivitis; vaccine;

             AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAX94583. AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used to detect Porphorymonas gingivalis. Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX34318 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising a sequence not given in the specification, a recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for diagnosing or treating Enterococcus faecalis infection. This sequence represents an E. faecalis polypeptide of the invention.
AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation be used to prophorymonas gingivalis is involved in periodontal disease especially gingivitis. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.

Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid encoding a promoter operably linked to the nucleic acid conditions are inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or list fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway confideration; (7) identifying a compound that inhibits proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling the extent or agene on which the test compound that inhibits proliferation of the strains in spresent in a culture or collection of the craning the trains in spresent in a culture or collection of the strains in spresent in a culture or collection of the strains in present in a culture or collection of the strains in present in a culture or collection of the strains in present in a culture or collection of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational cauged are useful or required for proliferation in cells other than S. aureus, S. typhimurium,

The genome is preferably the genome of a hyperthermostable archaebacterium, particularly Thermococcus kodakaraenis KODI. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the disturbinon of a gene at an arbitrary position in a genome can be achieved efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived using the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitting in the published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises beta-secretase inhibitory peptides. The beta-secretase inhibitory peptides of the invention are useful for the prevention or treatment of neurodegenerative diseases, such as:
Alzheimer's disease, Parkinson's disease, neuropathy, postencephalitis, cerebral palsy, and memory loss. The beta-secretase inhibitory peptides of the invention are also useful in the manufacture of an sAPPR secretion promoter or neurotropic factor-like agent. The present amino acid sequence represents a beta-secretase inhibitory peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "(2R, 3S)-3-amino-2-hydroxy-4-phenylbutanoic acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel compound such as beta-secretase inhibitor, useful as preventive or therapeutic agent for treating neurodegenerative disease such as Alzheimer's disease, Parkinson's disease and neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               beta-secretase inhibitory peptide; neurodegenerative disease;
Alzheimer's disease; Parkinson's disease; neuropathy; postencephalitis;
cerebral palsy; memory loss; AAPPA secretion promoter;
neurotropic factor-like agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleoride sequences can be used in gene therapy. ORFX sequences can be used in the transplantation, reloid, degenerative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders related to organ transplantation, cardiovascular diseases, disorders related to organ storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by De acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of p. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and activity of P. acnes polypeptides and activity of P. acnes polypeptides and activity of P. acnes proteins. The antibodies and also be used as the activity of P. acnes proteins of the analyses of the activity of P. acnes proteins of the analyses of the activity of P. acnes proteins activity of P. acnes proteins activities and the activity of P. acnes proteins activity of P. acnes proteins activities and the activities activities and the activities activities activities and the activities activities activities activit
                                                                                                                                                                                                                                                                                                                                                                                                      SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uvaitis; endopthalnitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; engryme linked immunosorbent assay; dermatological; osteopathic; neuroprotectent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polypeptides and nucleic acids useful for diagnosing infections, especially useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bhatia A;
                                                                                                                                                                                                                                                                                                                                                      Propionibacterium acnes immunogenic protein #17674.

The invention relates to an isolated polymucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM643536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a comprising a polypeptide of the invention; a polymucleotide of the invention; antibodies against polypeptides of the invention; a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared to polymucleotides, autibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit of detecting or determining the presence or absence of P. acnes in a patient; The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polympeptides are useful for diagnosing, preventing or treating acne proteins, T cell populations or antigen-presenting cells that express the polympeptides are useful for diagnosing, preventing or treating acne protein. The polymucleotides can also be used as probes or primers for uncleic acid hybridisation; an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form tart of the printed specification, but an electronic form the directly and the polymention and the polymention and the polymention and patent did not form part of the printed specification, but an electronic form the polyment of the printed specification, but an electronic form the polyment of the printed specification, but an electronic form the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a secretory polynucleotide (designated sptm) comprising any of 567 polynucleotide sequences (AB23583-AB236403), a naturally occurring polynucleotide sequence at least 90 % identical to the polynucleotide complementary to them or an RNA equivalent of them. The polynucleotide complementary to them or reacting, preventing or diagnoshing a disease or condition associated with the expression of functional SPTM. These are particularly useful for diagnoshing, treating or preventing autoimmune/inflammatory disorders (e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human secretory proteins and polynucleotides, useful for diagnosing, treating or preventing autoimmune/inflammatory disorders (e.g. AIDS), neurological disorders (e.g. Alzheimer's), or cell proliferations or

                                                                                                                                                                                                                                                                                                                                      a
                                                                                                                                                                                                                                               ö
          immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                              system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzeimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic as the activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Q.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wang D;

Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.

N-PSDB; AAI61142

```
The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic.

Immunosuppressant and cytostatic activity. The polynucleotides are useful immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, ancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and State and Alzeimer and the sequence data for this patent did not form
                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic.

encoded polypeptides (AAM36642-AAM42213) with nootropic.

immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous foralised neuropathies and central nervous system diseases, and as Alzheimer's, parkinson's disease, system disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activity, inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form
Novel nucleic acids and polypeptides, useful for treating disorders such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel three dimensional structure of Thermus thermophilus 70S ribosome resolved using x-ray crystallography upto 5.5 Angstroms resolution, useful for screening and designing compounds that alter ribosome

ö
Angstrom resolution. The invention also discloses a method for identifying a compound that binds to a bacterial 70S ribosome or its portion. The method comparises designing a compound based upon a three-dimensional structure of the bacterial 70S ribosome, where the structure co-ordinates are given in the specification, contacting the compound with the bacterial 70S ribosome or its portion and determining whether the compound binds to the bacterial 70S ribosome or its portion. The 70S ribosome of the invention can be used to screen and design ribosome 3D structure of the invention can be used to screen and design compounds that bind to sites on the 70S ribosome and that alter the ribosome function. The present sequence represents a ribosomal protein sequence used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated applypeptide or its fragment whose expression is inhibited by the antisense aucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense; prokaryotic essential gene; cell proliferation; drug design.

Claim 25; SEQ ID NO 51903; 1766pp; English.

```
the inversion relaters to an isolated muchalc acts comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation is inhibited by the antisense encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated continued in a polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or that has an activity against a biological pathway or the proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture computing strains in which the each of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are pational for dentifying proteins or screening for homologous nucleic acids are pational for dentifying proteins or screening for homologous nucleic acids are pational for dentifying proteins or screening for homologous nucleic acids are pational for dentifying the description of the description of the strains is solutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. RESULT 26

Oil-associated gene related protein #36.

06-MAY-2004 (first entry)

oil-associated gene; transgenic; enhanced seed oil; vegetable oil. Unidentified.

JS2004025202-A1.

The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of
                                                           Novel recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene for producing transgenic
                                                                                                                                                                                         genome
                                                                                                                                                                    promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil-associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pneumoniae proteins and related DNA - useful for screening

The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies
such a polypeptide. They can also be used to screen for compounds which interact with and inhibit or activate such a polypeptide. The polypeptides (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;
                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful treating acne vulgaris.
                                                                                                                                                                                                                                              ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    encoding a Propionibaccerium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ARM35624-ARM64536) and to additionally encompassed by a conse polypeptides. The invention additionally encompassed expression vectors and host cells comprising a polymucleotide of the invention; antibodies against polypeptides of the invention; fusion proteins comprising a polypeptide of the invention; an ethod for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention relates to an isolated polynucleotide (ACF64435-ACF64733)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Maisonneuve JL;

ö
proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present and the kit is useful for performing a diagnostic assay. The present reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated antisense appression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zyskind JW;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
```

AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations
                                                                                                                                                                                                                                                                                   ö
vaccines against Chlamydia trachomatis. Antisense and ribozyme sequent can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perity perihepatitis, bartholinitis; pneumopathy in breast feeding infants; wenereal lymphogranulomatosis. The polypeptides of the invention may of use in treating these diseases
                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated binding pocket (I) of a receptor tyrosine kinase (RTK) that regulates the kinase domain of RTK. A crystal (II) comprising a binding pocket of an RTK that regulates the kinase domain of the RTK, or comprising a juxtamembrane region and/or kinase domain of an RTK or its part, or formed by a juxtamembrane region and a Kinase region of an RTK in an autoinhibited state and a model (III) of (I) made using (I); are useful for determining the secondary and/or tertiary structure of a polypeptide, or for screening for a ligand capable of binding to a binding pocket and/or inhibiting or enhancing the atomic contacts of interactions in a binding pocket. (I) is useful for identifying a modulator of an RTK. (II) is useful for designing, modelling, identifying, evaluating and/or synthesizing mimetics of a
responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel isolated binding pocket of receptor tyrosine kinase that regulates the kinase domain of the receptor, useful for identifying modulator of the receptor for treating lymphoproliferative conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Receptor tyrosine kinase; RTK; kinase domain; cytostatic; antiarthritic; antiinflammatory; immunosuppressive; antirheumatic; virucide; noctropic; neuroprotective; cerebroprotective; antiparkinsonian; dermatological; nephrotropic; tranquilizer; vulnerary; anticonvulsant; VAB-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "residues Xaa are not clearly indicated in the specification"

The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also
          make a model for (1) or its complexes or parts, in X-ray crystallography techniques, or for determining three-dimensional structures of polypeptides with unknown structures. Pharmaceutical compositions comprising the ligand or modulator is useful for treating lymphoproliferative conditions, malignant and pre-malignant conditions lymphoproliferative conditions, malignant and pre-malignant conditions lupus erythematosus, immune-related glomerulonephritis, rheumatoid arthritis), viral infection, inflammation, gaft versus host disease, neurodegenerative diseases and conditions involving trauma and injury to the nervous system (e.g., Alzheimer's disease, Parkinson's disease, Huntington's disease and multiple sclerosis). The present sequence represents a VAB-1 protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Carr GJ;

sequence not defined in the specification, for amplifying a target

cequence contained within a Streptococcus nucleic acid sequence, where

the first primer is substantially complementary to the target sequence

and the second primer is substantially complementary to the complement

the target sequence, and where the parts of the primers having

the target sequence and where the parts of the primers having

considerably assay comprising contacting a test compound with the

protein, and determining whether the test compound binds to the protein

and a Streptococcus pneumoniae bacterium, where one or more genes

concoding the proteins has been renderive. The proteins, nucleic

acid molecules, antibody and compositions are useful as medicaments for

treating or preventing a disease or infection due to streptococcus

bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis

media or ear infection. They are also useful in developing vaccines,

diagnostics and antibiotics. The methods are useful for identifying

immunodominant proteins. The present sequence is one of the 2469 proteins

expressed by the identified coding regions from the genomic sequence.

Note: The sequence data for this patent did not form part of the printed

specification, but was obtained in electronic format directly from WIPO

at ftp.wipo.int/pub/published_pot_sequences. (Updated on 23-OCT-2003 to

        development. The antisense muckels adids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or

N-PSDB; ABX06581

Claim 1; SEQ ID NO 1738; 56pp; English.

infection

The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a

Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8)
               one of the polymucleotides. The S. pneumoniae polymucleotides and encoded bolymeptides (ABPR1299-ABPR1674) are useful for treating or preventing S. pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for detecting S. pneumoniae in a biological sample or disgnosing S. pneumoniae in a biological sample or disgnosing S. pneumoniae infection in a subject. The polymucleotides have antibacterial activity and are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention relates to an isolated nucleic acid comprising any one of
 of the polynucleotide or a nucleic acid sequence 95% identical

```
pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which he gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, C. T. promumoniae or P. aaruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Mote: The sequence data for this present did not form part of the printed specification, but was obtained the control of the printed specification, but was obtained the control of the printed specification, and the control of the printed specification, but was obtained the control of the printed specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated Streptococcus pneumoniae nucleic acids and polypeptides. The nucleic acids and proteins are useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, such as S. pneumoniae infection. These may also be used for drug screening procedures. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecules and polypeptides useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, e.g. Streptococcus pneumoniae infection, and in drug

```

```
New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                    Antisense; prokaryotic essential gene; cell proliferation; drug design.
                      Protein encoded by Prokaryotic essential gene #9133
                                                                                                                                                                                                                                                                  Claim 25; SEQ ID NO 51530; 1766pp; English.

Malone C, Carr GJ,

the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense contisense mucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular or the activity of the gene product or that has an activity against a biological pathway contained for proliferation, or that inhibits cellular proliferation; (8) required for cellular proliferation or the biological contained for cellular proliferation or the biological contained for cellular proliferation or the biological contained agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling the extent or organism or the strains is present in a culture or collection of contains; or (13) identifying the target of a compound that inhibits the contained contains; or (13) identifying the target of a compound collection of an organism. The antisense nucleic acids are useful for cellular proliferation or product antidetes molecules for rational contains or for extension or antidetense nucleic acids are useful for cellular proliferation or sorganism or prover andideted molecules for rational ö drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences The invention relates to an isolated nucleic acid comprising any one of Gaps ; 0 DB 6; Length 367; 82.8%; Score 24; DB 6; Length 367 ilarity 71.4%; Pred.                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     encoded polypeptides (AAM38642-AAM42213) with nootropic, immonsuppressant and cytostatic activity. The polymorleotides are useful in gene therapy. A composition containing a polymorleotide are useful of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic utilisation of the activities such as: Immune system suppression, and thrombolytic activity, cancer disagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ą,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human nucleic acids (AAIS7798-AAI61369) and the

bacterial, fungal, parasitic, protozoal or helminthic infections and cell proliferative disorders such as cancer. Fragments of MTRP polymucleotides are useful as targets in microarrays. WTRP DNA is useful for generating hybridisation probes useful in mapping genomic sequences and detecting differences in sequences among normal, carrier and affected individuals.

is also used for screening libraries of compounds in drug screening

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM3213) with nootropic, fimunosuppressant and cyrostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ě,

The present sequence is a membrane transport protein, WTRP-1 from Incyte clone 961344 isolated from human BRSTYTUTO3 CDNA library. WTRP-1 shows homology to the mouse E1-E2 ATPase and is expressed in reproductive, nervous and haematopoietic/immune tissues. The present sequence is useful in diagnosis, prevention and treatment of disorders related with increased or decreased expression of WTRP such as familial goitre, Menkes disease, diabetes, Parkinson's disease, neurological disorders such as ALDS. ALAbimer's disease, depression, epilepsy, schizophrenia, immune/inflammatory disorders such as ALDS, Addison's disease, allergies, atherosclerosis, Graves disease, gout, Hashimoto's thyroiditis, viral,

                                                                                                                                                                                                  ö
          localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic as the transport of the activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Wang D;

              in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous totalised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Auntington's disease, amyotrophic lateral seclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, ancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid encoding an insect gustatory receptor (Gr) or odorant receptor (Or) protein which comprises seven transmembrane domains and a C-terminal domain comprising consecutive amino acids. The invention is useful for identifying a compound which activates the insect receptor or inhibits the activity of a lipid bilayer. The purified insect receptor protein is embedded in a lipid bilayer. The invention is sprayed for combating ingestion of crops by pest insects, combating disease-carrying insects in an area and controlling a pest population in an area. The invention is useful for detecting the presence of insect gustatory or odorant receptor and for inhibiting the function of the receptor in humans or animals or in biological fluids isolated from them. The invention is also useful for identifying or isolating other insect receptors and for combating pest
immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acid encoding insect gustatory or odorant receptor protein useful for identifying a compound which specifically binds to the receptor for controlling a pest population in an area.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fruit fly; gustatory receptor; Gr; odorant receptor; Or; pesticide;

This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to convacious and the encoded proteins thereof. Specifically, it refers to convacious describes an immunoassay to identify agonists and antagonists, as well as attibodies, antisense molecules and siRNAs that can all be used to bind to antibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these concludes are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintaining equilibrium of sense or motor function, and for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, noctropic, antiparkinsonian, encoded by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but

the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid;

(2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or gene on which the test compound that inhibits spilling a companial acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or compound, and the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for
                                                                                                                                                                                                               screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. arreus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at
                                                                                                                                                                                                                                                                                                                                                  invention relates to an isolated nucleic acid comprising any one of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the genomic sequence of Pyrococcus abyssi (see AAF86431 and AAH41223-7) and P. abyssi proteins. P. abyssi is a hyperthermophilit archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is one such P. abyssi protein. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. Note: This patent is in the same patent family as WO200065062, which contains additional sequences as shown in AAB99132-AAB99143, AAH75903-AAH75920 and AAG66436
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleotide sequences isolated from Pyrococcus abyssi encode proteins useful in industry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.

The invention fracters to an interior action where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operor required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation of an identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profifing a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed, (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for contilieration of an organism. The antisense nucleic acids are useful for an inhibits and acids required for cellular proliferational according an encoding and according an encoding and according an encoding and according an encoding according according according according a collection of an organism. The antisense nucleic acids are useful for cellular proliferation of sections or screening for homologous nucleic acids are useful for according accordin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                New antisense nucleic acids, useful for identifying proteins or scre

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA aequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense; prokaryotic essential gene; cell proliferation; drug design.

the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell contening the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation of an organism cellular proliferation of an organism of the candidate molecules for rational additional acciding the description of an organism of the activity of a compound that inhibits the proliferation of an organism of the candidate molecules for rational additional acciding the capage of a compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                     New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

New recombinant DNA construct comprising a promoter positioned to provious expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1, SEQ ID NO 5367; 122pp; English.

```
of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant thaving an improved property. The plant is a crop plant such as malze or soybean. The method of producing a transformed plant ecombinant DNA construct and stransforming a plant with the recombinant DNA construct and growing the transformed plant polynucleotide or polypeptide is useful for improving plants with the polynucleotide or polypeptide is useful for producing plants with improved plant properties. Figure osen cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes an isolated polymucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polymucleotide (I), its complement, despendente variant or fragment; (3) a genetically engineered comparison vector comprising the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide, its complement, biological composition comprising the polypeptide, its composition comprising the polypeptide, its composition comprising the polypeptide of (I); (8) an immunogenic composition for the polypeptide (II) a protein chip comprising in the expression vector; (6) a pharmaceutical composition comprising an array of the polypeptides of (I), their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus otitidis by administering to a host the contraining the novel polymucleotide, its degenerate variant or fragment; or the antibody of (4); and (11) producing a polypeptide by culturing the genetically engineered host cell under conditions suitable to produce the polypeptide from the culture. (I) can be used in gene therapy. The polypeptide from the culture. (I) can be used in gene therapy. The polymucleotides prosent and and angening and detecting Alloiococcus oritidis. The present sequence represents an Alloiococcus otitidis. The present sequence represents an Alloiococcus otitidis. The present from the navelent for expressing and detecting Alloiococcus otitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antibacterial; vaccine; antisense therapy; Staphylococcus epidermidis; recombinant expression vector; infection; computer readable medium; computer based system.
                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and enrociding an Staphylococcus epidermidis polypeptide with any of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as given in the specification. Also described are: a recombinant expression vector; a cell comprising a recombinant expression vector of (1); producing an S. epidermidis polypeptide; an isolated nucleocide signature of a least 8 nucleocides in length; a vaccine composition for prevention or treatment of an S. epidermidis infection, comprising a nucleocide acid cited above and a carrier; treating a subject for S. epidermidis infection; a recombinant or substantially cure preparation of an S. epidermidis polypeptide or its fragment; a vaccine composition for prevention or treatment of an S. epidermidis infection; detecting the presence of a Staphylococcus mucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide system for identifying fragments of the Staphylococcus genome of commercial importance; a computer based system for identifying fragments of the Staphylococcus genome and/or plasmids of commercial important nucleic acid fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment commercially important in the present invention are useful for the diagnosis, prevention and/or treatment of an Staphylococcus poidermidis bacterial infection. This is the amino acid sequence of a S. epidermidis bacterial of the antico.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó,

The present invention describes an isolated polymucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis ganomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I) an isolated polypeptide that is encoded by the polymucleotide (I); (2) an isolated polypeptide that is encoded by the polymucleotide (I); (2) an expression vector comprising the novel isolated polymucleotide (I); (2) an expression vector fragment or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (1); (5) an immunogenic composition comprising the polypeptide of (1); (6) a pharmaceutical composition comprising the expression vector; (6) a pharmaceutical composition comprising an array of the polypeptide of (1) and a carrier; (7) a protein chip comprising the expression vector; (6) a pharmaceutical composition composition; (9) detecting and/or identifying Alloiococcus of the polypeptides of (1), their biological equivalent or fragment, (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus otitidis in the biological sample; (10) a kit comprising a container containing the movel polymucleotides, polymeptide from the culture. (I) can be used in gene therapy. The colypeptide from the culture. (I) can be used in gene therapy. The polymucleotides, and onlicoting and diagnosing diseases, drug invention can be used for treating and diagnosing diseases, drug creening assays and monitoring of effects during drug clinical trials. The polymucleotides are useful for expressing and detecting officials antigen protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated polymucleotide (I) of
Alloiococcus otitidis genomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis ganomic DNA, which encodes an antigenic protein.
Alloiococcus otitidis is a Gram-positive bacterium. Also described: (I)
an isolated polypeptide that is encoded by the polymucleotide (I); (2) an expression vector comprising the novel isolated polymucleotide (I); (2) an expression vector of (2);
(4) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide of (I) and a carrier; (7) a protein chip comprising the expression vector; (6) a pharmaceutical composition comprising an array of the polypeptide of (I) and a carrier; (7) a protein chip comprising the expression vector; (6) a detecting and/or identifying an array of the polypeptide of (I) and a carrier; (7) a protein chip comprising an array of the polypeptide of (I) and a carrier; (7) a protein chip comprising the composition; (8) detecting and/or identifying Alloiococcus of the polypeptide from the culture. (I) a kit comprising a container composition; (9) detecting and/or identifying Alloiococcus of the present invention can be used for treating and diagnosing diseases, drug creaming assays and monitoring of effects during drug clinical trials.

The polyputleotides, polypeptides, antibodies and compositions of the present invention culture. (I) can be used distorbed by culturing Alloiococcus officials. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAR51280-82 represent varients of the helminth aminopoptidase H110D encoed by the genes H11-3, -2 and -1 respectively. H110D is a protein doublet which shows homolay to a family of integral membrane aminopoptidases. The differences between the coding sequences and the translated products, can be attributed to different mRNAs of the willigene family, and also to different variants of the H110D-encoding sequence being present at different stages of the life cycle, or in strains differing in geographical origin. Antigenic fragments of these aminopoptidases may be used in vaccines to stimulate immune response against helminth parasites in humans or other animals. The DNA sequences encoding these proteins may be incorporated into a virus or microbe and used in a similar manner. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                    New DNA encoding amino-peptidase from Haemonchus contortus and derived peptide(s) - useful in protective vaccines, for new vectors, transformed cells and oligosaccharide, for incorporation in virus or microbe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence represents the human 67084FL protein, which is a member of the transporter family. The transporter family proteins (1) of the present invention have anorectic, antidabetic, anti-Parkinsonian, nootropic, neuroprotective, hypotensive, antidaperseant, neuroleptic, cardiovascular and immunosuppressive activities, and can be used in gene therapy. The human transporter proteins from the present invention are cadiovascular and immunosuppressive activities, and can be used in gene therapy. The human transporter proteins from the present invention are casing assignated 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL and sasays (e.g. chromosome mapping, tissue typing, or in forensic biology), credictive medicine (e.g. diagnostic assays, prognostic assays, prognostic assays, controling clinical trials, or pharmacogenetics), as surrogate markers, and in methods of treatment (e.g. therapeutic or prophylactic). (1) are useful for treatment (e.g. therapeutic or prophylactic). (1) are useful for treatment (e.g. therapeutic or prophylactic). (1) are useful for treatment of 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt substrates or production of transport 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 46455 include disorders associated with sugar homeostasis cuch as obesity, diabetes or anorexia. Disorders associated with Sugar homeostasis. Cc 53763, 67076, 67102, 44181, 67084FL or 67084alt are e.g. CNS disorders (e.g. Parkinson's disease or Alzheimer's disease), autonomic function disorders (e.g. ammesia or age-related disorders), cradiovascular disorders (e.g. hypothyroidism or hyporthyroidism), crestenosis), hormonal disorders (e.g. hypothyroidism or hyporthyroidism), cc restenosis), hormonal disorders (e.g. hypothyroidism or hypothyroidism), cc restenosis), hormonal disorders (e.g. hypothyroidism or hypothyroidism), cc

                                                                                                                                                                                                                                                                                                  transporter family. The transporter family proteins (1) of the present invention have anorectic, antidiabetic, anti-Parkinsonian, nootropic, neuroprotectitive, hypotensive, antidepressant, neuroleptic, cardiovascular neuroleptic, cardiovascular and immunosuppressive activities, and can be used in gene therapy. The human transporter proteins from the present invention are designated solys, 46455, 54444, 53763, 67076, 67102, 44181, 67084FL and 67084alt. The polynucleotides encoding (1) can be used in screening assays (e.g. chromosome mapping, tissue typing, or in forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical transment (e.g. therapeutic or prognesics), as surrogate markers, and in methods of treatment (e.g. therapeutic or prophylactic). (1) are useful for treating disorders characterised by insufficient or excessive production of 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt inhibitors Disorders associated with 8099 and 44181, 67084FL or 67084alt inhibitors Disorders associated with sugar homestals such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        obesity, diabetes or anorexia. Disorders associated with 54414, 53763, 67102, 44181, 67084FL or 67084alt are e.g. CNS disorders (e.g. Parkinson's disease or Alzheimer's disease), automaic function disorders (e.g. hypertension, depression or schizophrenia), or learning or memory disorders (e.g. amnesia or age-related disorders), cardiovascular disorders (e.g. ischaemia reperfusion injury or restenosis), hormonal disorders (e.g. hypothyroidism or hyperthyroidism), or immune disorders (e.g. chronic mucocutaneous candidiaeis). The present sequence represents a human transporter protein related protein from the present invention
                                                                                                                                                                                       New 67076, 67102, 44181, 67084FL and 67084alt nucleic acids and proteins, useful in e.g. treating disorders characterized by insufficient or excessive production of the polypeptides, e.g. cardiovascular or immune

encoding a human transporter protein, or its complement, a sequence that is 60 % identical to the CDNA, a fragment comprising at least 30 nucleotides of the CDNA, or a sequence encoding a fragment of the polypeptide comprising at least 10 contiguous amino acid residues of the CDNA. Also included are a vector comprising the novel nucleic acid molecule, producing the polypeptide, the isolated transporter polypeptide, an isolated antibody that specifically binds to the polypeptide, detecting the presence of the polypeptide or nucleic acid in a sample, a kit, identifying a compound that binds to, or that modulates the activity of, the polypeptide, and modulating the activity of the polypeptide. The nucleic acid is useful for preparing a composition for treating PGC-1 (not defined) associated disorders e.g. liver tumours, obesity, epilepsy or diabetes. The present sequence represents a novel

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611,

IC47615, HNWDA-1, TWIK-9, alpha-2delta-4, 54414 and 53763 ion channel

Emily (ICF) nucleic acids and proteins. The TWIK-7, IC23927,

TWIK-8, IC47611, IC47615, HNWDA-1, TWIK-9, alpha-2delta-4, 54414 and

Emily (ICF) nucleic acids and proteins may be used for preventing,

TWIK-8, IC47611, IC47615, HNWDA-1, TWIK-9, alpha-2delta-4, 54414 and

CHARLES ICF nucleic acids and proteins may be used for preventing,

CHARLES ICF nucleic acids and proteins may be used to treat disorders associated with decreased expression by rectifying

TRIP creat disorders associated with decreased expression by rectifying

TRIP creat disorders in a patient's genome that affect the activity of

CH proteins by expressing inactive proteins or to supplement the

patients own production of ICF proteins. The proteins may also be used as antigens in the production of antibodies against ICF proteins and in

assays to identify modulators of ICF protein expression and activity. The

anti-ICF protein expression and activity. The antibodies may also be

cregulate ICF protein expression and activity. The antibodies may also be

cred as diagnostic agents for detecting the presence of ICF proteins in

samples (e.g. by immunoassay). The nucleic acids and proteins may be used

to prevent, diagnose and treat a wide variety of disorders, e.g. cancers

and leukaemia, Alzheimer's disease, Parkinson's disoraes, multiple

sclerosis, epilepsy, hepatic disorders and cardiovascular disorders. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha2delta-4, 54414, or 53763 nucleic acids and proteins, useful for preventing, diagnosing and treating e.g. cancers, Alzheimer's disease and cardiovascular disorders.

The present sequence represents the fundamental process.

C member of the transporter family. The transporter family proteins (1) of the present invention have anorectic, antidiabetic, anti-Parkinsonian, cootropic, neuroprotective, well-depressant, neuroleptic, cardiovascular and immunosuppressive, activities, and can be used in gene therapy. The human transporter proteins from the present invention are designated 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL and 67084alt. The polynucleotides encoding (1) can be used in screening assays (e.g. chromosome mapping, tissue typing, or in forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, compitoring clinical trials, or pharmacogenetics), as surrogate markers, and in methods of treatment (e.g. pherapeutic or prophylactic). (I) are useful for treating disorders characterised by insufficient or excessive production of 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt substrates or production of transport 8099, 46455, 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt inhibitors. Disorders associated with sugar homeostasis cuch as obesity, diabetes or anorexia, Disorders associated with 54414, 53763, 67076, 67102, 44181, 67084FL or 67084alt are e.g. CNS disorders (e.g. parkinson's disease or Alzheimer's disease), autonomic function of disorders (e.g. hypertension, depression or schizophrenia), or learning or memory disorders (e.g. hypertension, depression or schizophrenia), or learning or cardiovascular disorders (e.g. hypertension, the hypertension of the hypertension of the hypertension of the hypertension of the hypertension, the hypertension of the hypertension of the hypertension of the hypertension of the hypertension, the hypertension of the hypertension of the hypertension of the hyperte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; transporter protein; anorectic; antidiabetic; anti-Parkinsonian; nootropic; neuroprotective; hypotensive; antidepressant; neuroleptic; cardiovascular; immunosuppressive; gene therapy; sugar homeostasis; obesity; diabetes; anorexia; central nervous system disorder; depression; CNS disorder; Parkinson's disease; Alzheimer's disease; hypertension; autonomic function disorder; schizophrenia; learning disorder; amnesia; memory disorder; age-related disorder; cardiovascular disorder; ischaemia reperfusion injury; restenosis; hormonal disorder; hypothyroidism; hyperthyroidism; immune disorder;
                                                                                                                                                                                      New 67076, 67102, 44181, 67084FL and 67084alt nucleic acids and proteins, useful in e.g. treating disorders characterized by insufficient or excessive production of the polypeptides, e.g. cardiovascular or immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 restenosis), hormonal disorders (e.g. hypothyroidism or hyperthyroidism), or immune disorders (e.g. chronic mucocutaneous candidiasis)
                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the human 67084alt protein, which is a

transporter family. The transporter family proteins (I) of the present invention have anorectic, antidiabetic, anti-Parkinsonian, nootropic, invention have anorectic, antidiabetic, anti-Parkinsonian, nootropic, and immunosuppressive activities, and can be used in gene therapy. The human transporter proteins from the present invention are designated (1) 2019, 44611, 67084F. and 67084att. The polynucleotides encoding (I) can be used in screening assays (e.g. chromosome mapping, tissue typing, or in forensic biology), predictive medicine (e.g. diagnostic assays, prognostic assays, monitoring clinical trails, or pharmacogenetics), as surrogate markers, and in methods of transpentic or prophylactic). (I) are useful for treating disorders characterised by insufficient or excessive production of 8099, a 46455, 54414, 53763, 67076, 67102, 444181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8099 and 44181, 67084FL or 67084alt inhibitors. Disorders associated with 8040 and 67084alt inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                obesity, diabetes or anorexia. Disorders associated with 54414, 53763, 67102, 44181, 67084FL or 67084alt are e.g. CNS disorders (e.g. Parkinson's disease or Alzheimer's disease), autonomic function disorders (e.g. hypertension, depression or schizophrenia), or learning or memory disorders (e.g. amnesia or age-related disorders), cardiovascular disorders (e.g. ischaemia reperfusion injury or restenosis), hormonal disorders (e.g. hypothyroidism or hyperthyroidism), or immune disorders (e.g. chronic mucocutaneous candidiashs). The present sequence represents a protein given in comparison with a human transporter protein from the
                                                                                                                                                                                                                                                                                                                         New 67076, 67102, 44181, 67084FL and 67084alt nucleic acids and proteins, useful in e.g. treating disorders characterized by insufficient or excessive production of the polypeptides, e.g. cardiovascular or immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    82.8%; Score 24; DB 5; Length 1095; 71.4%; Pred. The invention relates to an isolated nucleic acid comprising a cDNA encoding a human transporter protein, or its complement, a sequence that is 60 % identical to the cDNA, or a sequence encoding at least 30 nucleotides of the cDNA, or a sequence encoding a fragment of the polypeptide comprising at least 10 contiguous amino acid residues of the cDNA. Also included are a vector comprising the novel nucleic acid molecule, producing the polypeptide, the isolated transporter polypeptide, an isolated antibody that specifically binds to the polypeptide, an isolated antibody that specifically binds to the polypeptide, a kit, identifying a compound that binds to, or that modulates the activity of, the polypeptide, and modulating the activity of the polypeptide. The nucleic acid is useful for preparing a composition for treating pGC-1 (not defined) associated disorders e.g. liver tumours, obesity, epilepsy or diabetes. The present sequence represents a species homologue of a novel human transporter protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, transporter; cytostatic; anorectic; antidiabetic; anticonvulsant;

                                                                                                                                              encoding a human transporter procein, or its complement, a sequence that its for & identical to the cDNA, or a sequence encoding a fragment of the polypeptide comprising at least 30 nucleotides of the cDNA, or a sequence encoding a fragment of the polypeptide comprising at least 10 contiguous amino acid residues of the cDNA. Also included are a vector comprising the novel nucleic acid molecule, producing the polypeptide, the isolated transporter polypeptide, an isolated artibody that specifically binds to the polypeptide, a kit, identifying a compound that binds to or that modulates the activity of, the polypeptide, and modulating the activity of the polypeptide, and modulating the activity of the polypeptide, and modulating the activity of the reacting polypeptide, and modulating the activity of the recent of its useful for preparing a composition for treating poct-1 fort defined associated disorders e.g. liver tumours, obesity, epilepsy or diabetes. The present sequence represents a novel human transporter protein.
                                                  New isolated nucleic acid, useful for preparing a composition for treating PGC-1 associated disorders e.g. liver tumors, obesity, epilepsy or diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; 67084alt; ion channel family; ICF; cancer; leukaemia; Alzheimer's disease; Parkinson's disease; multiple sclerosis; epilepsy; hepatic disorder; cardiovascular disorder; cytostatic; neuroprotective; nootropic; antiparkinsonian; hepatotropic; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                   invention relates to an isolated nucleic acid comprising a cDNA
                                                                                                                                                                                                                                                                                                                                                                                        ö

CC diagnosing and treating ICF-related diseases. The sequences and be used to treat disorders associated with decreased expression by rectifying of contigens of ICF proteins and the activity of patients own production of ICF proteins. The proteins and an in the production of antibodies against ICF proteins and in assays to identify modulators of ICF protein expression and activity. The antibodies may be used to regulate ICF protein antibodies, agonists and antagonists may be used to regulate ICF protein antibodies, agonists and activity. The antibodies may be used to prevent, diagnose and treat a wide variety of disorders, e.g. cancers and leukaemia, Alzheimer's disease, Parkinson's disease, multiple and leukaemia, Alzheimer's disease, Parkinson's disease, multiple contents the human 67084alt protein of the invention. Note:

The sequence data for this patent is also available in electronic format from USPFO at segdata.uspto-gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TWIK-6, TWIK-7, IC23927, TWIK-8, IC47611, IC47615, HNMDA-1, TWIK-9, alpha2delta-4, 54414, or 53763 nucleic acids and proteins, useful for preventing, diagnosing and treating e.g. cancers, Alzheimer's disease and cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mouse; ion channel family; ICF; cancer; leukaemia; Alzheimer's disease; Parkinson's disease; multiple sclerosis; epilepsy; hepatic disorder; cardiovascular disorder; cytostatic; neuroprotective; nootropic; antiparkinsonian; hepatotropic; cardiovascular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for
preparing a vaccine composition against Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.
